

TEAM NAME: ThatManiac

AI reinvention made real

Accenture Innovation Challenge 2026

Team details

TEAM NAME: ThatManiac

Nikhil Menaria

College: IIT Dhanbad (ISM)
Stream: Mechanical Engineering (3rd Year)
Year of graduation: 2028

Comprehensive Analysis of Problem Statement

Every dashboard answers '**what.**' None answer '**why.**' Dashboards detect what moved but stop there. KPI ↓X% → "Why?" → 2–3 days of manual investigation.

Three Fundamental Problems

Signal vs. Noise

37% of analysts spend **61–80%** of their time on data prep, not analysis

No consistent filter for real change vs. noise, teams chase false positives, miss real signals

Correlation → Causation → Action

~20% of organizations are strong at data-driven decision-making

BI shows what moved together, not what to do next. Turning correlation into a decision still requires manual hypothesis-building

Fragmented Evidence + Ambiguity

80–90% of enterprise data is unstructured and largely excluded from investigation

Structured and unstructured data never connect and multiple causes get forced into one answer.

Visualization-first BI

optimized to report metrics, not investigate causes

Fragmented data landscape

ERP / CRM / HR / POS / tickets / calls / news, no shared query surface

No confidence aware hypothesis framework

systems produce a single answer even when evidence is genuinely ambiguous

Root Causes

Business Consequence

Failure Mode

What It Costs

Delayed diagnosis

Lost revenue keeps accruing while the answer is still being found

Wrong diagnosis

Resources get deployed against the wrong lever

False certainty

Teams act on the most attractive story, not the best-supported one

No diagnosis

Same anomaly gets reinvestigated from scratch every time it recurs

Proposed Solution - Working MVP | StratIQ

StratIQ : An AI analyst, not an AI narrator: detects the signal, investigates the evidence, ranks competing explanations, and recommends what to do next.

THE AMBIGUITY LAYER: If no hypothesis crosses the confidence threshold, the system doesn't force a conclusion. Prototype includes natural low-confidence and insufficient-history paths

Prototype Video Demonstration

Thank you
